A big thank you
to all our customers
who have taken the time
to share their positive
impressions about the
Condair HumiLife solutions.

»We live in a new home with controlled ventilation and our daughter has always suffered with eczema due to the extremely dry air. This led us to acquire the Condair HumiLife humidification system. As soon as it was installed, her symptoms improved and we no longer needed to use the cortisone ointment that we previously have had to use so frequently. A nice side-effect was the system's benefits for the other family members as well: the number and duration of colds fell considerably since the Condair HumiLife was installed, for young and old alike. We are amazed that we have not suffered any serious colds, even in the first winter following the coronavirus. That's something we hadn't counted on.

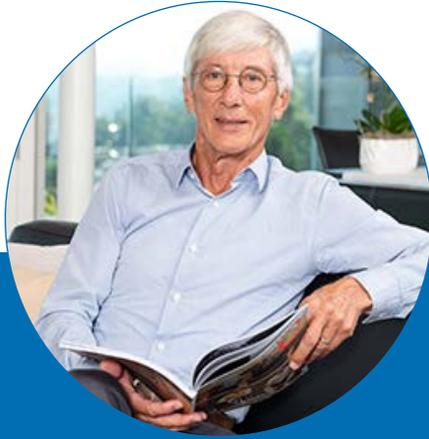

We've been so "pampered" by the pleasant humidity in the air in our home, that we're now thinking about having Condair HumiLife installed in our holiday home in Graubünden.«

»We own a duplex, in our duplex all rooms have parquet flooring (except for the bathrooms). Due to the low humidity levels (sometimes as low as below 30%), the wooden floors began to exhibit cracks and delamination, which needed to be “repaired” year after year. The supplier of the parquet refused any responsibility and suggested that we install a humidification system. We found your company on the internet. After the visit of one of your specialists, we quickly received a quote. It didn’t take us long to make a decision to purchase, on account of the expert and professional support.

Delivery, commissioning and induction were carried out promptly and professionally. The systems installed in each apartment have worked flawlessly from the outset. The system operation and the humidity can be checked and adjusted at any time via mobile phone app.

We have been pleasantly surprised that no damage of any kind whatsoever have appeared in the parquet.«

»We live in an apartment in the mountains. In the winter months, the relative humidity of the air indoors often drops below 30%. In the early years of living here, we attempted to increase the humidity in the main rooms of the apartment with individual humidifiers. This proved to be too laborious, so I went looking for a humidification solution that we could use in combination with our controlled ventilation system. The market offers a number of different solutions for introducing humidity into the supply air of residential ventilation systems. As an engineer, it was essential for me that the humidification system didn't cool the supply air, continued to work even at very low outdoor temperatures and did not allow humidity to condense in the supply ducts. As Condair is a market leader in professional humidification solutions and has many decades of experience, I quickly decided that the HumiLife steam solution was what I was looking for. The system can be operated and monitored easily with an app. It's also easy to maintain – I can replace the steam cylinder myself after two or three years.

The entire installation went without a hitch and was completed within a day and was completed within a day.«

»With the integrated ventilation in our house, we always had very dry air during the winter months. Thanks to Condair, this is now a thing of the past. The installation also went smoothly and to our complete satisfaction.«

»As a Condairemployee, I have experienced the comfort of a humidified office space. Counteracting dry air and thereby improving well-being and a healthier standard of living was crucial for the installation. The hoped-for beneficial change could also be realized in one’s own home within a reasonable financial framework for an existing house.

The importance of optimal indoor air humidification is still far from being recognized as it should be. I have also only become aware of it since I started working at Condaire. In the past, I had built humidifiers myself as water features and found that very helpful.

I helped plan the installation and also actively contributed a lot during the implementation.

Installation is possible not only in new buildings, but also in all types of existing buildings. Technically, it just takes some imagination to overcome existing thought patterns of how something should be installed.«

Alberr Gallati
Homeowner, Duplex

»My home is fitted with integrated ventilation, which is extremely practical, but does deliver extremely dry air through the winter months. I've suffered from it for many years and have tried out several mobile humidifiers. None of them was every successful in raising the humidity enough. Then a family member told me about Condair HumiLife. I had the nebulization system installed, which proved to be quick and easy. Since then, I've not experienced any problems with dry mucous membranes or cracked skin and lips. I can also see how much the new humidity has benefited my parquet floors. If only I had discovered Condair HumiLife sooner!«

»Today’s way of building homes is to seal everything up, which is great for the environment, but makes efficient humidification systems more essential than ever. The crux is that people too frequently fail to recognise the importance of humidification systems and go without them when constructing or renovating. That means that indoor spaces become too dry, which is not only uncomfortable but can really promote illness. At Klinova AG, we are all the more grateful that we can offer our customers the Condair HumiLife system. It’s an innovative and efficient product that does nothing but impress, and its inventor, Condair, is a company we consider a trustworthy and straightforward partner.«

Pascal Stucki

CEO of Klinova AG, installation partner

»I live with my family in a detached low-energy house. It's a great place to live, but the dry air during the heating season was a bit of a nuisance. That prompted us to look for a solution. I had previously worked in ventilation servicing, so I was in a good position to compare and contrast the different humidification systems on the market. The Condair HumiLife impressed me on the spot, and it hasn't let me down since. It ensures that our home has optimal humidification, which is essential to the comfort and health of my family. In addition, the constant humidity also means that valuable items around the home don't sustain damage. The outstanding environmental balance is also important to me – the heat that the Condair HumiLife system needs comes from our own solar system and heat pump.«

»When I retired, I managed to fulfil a dream of mine, which was to build a semi-detached house in Riederalp in Wallis. The unhindered view of the Alps, and even the Matterhorn, is spectacular. I spend around 20 weeks of the year here. I want to enjoy the time that I spend in my dream home, make sure that the structure of the building is well protected and protect the piano that belongs to my daughter, who's a pianist, so it's important that the indoor humidity is just right. At around 2000 metres above mean sea level, things are far from matter of course, but with Condair HumiLife, they're certainly possible. I am impressed by what this innovative system offers and how well it performs.«
